        {{ end }}
```

Can fetch data from management Cluster. Currently supported fetching from:

1. Cluster instance
2. Infrastructure Provider instance
3. KubeadmControlPlane instance
4. Secret

Snapshot and rollback

Sveltos can be configured to automatically store snapshot

```
apiVersion: utils.projectsveltos.io/v1alpha1
kind: Snapshot
metadata:
  name: hourly
spec:
  schedule: "00 * * * *"
  storage: /snapshot
```

A snapshot allows an administrator to perform the following tasks:

- 1.Live snapshots of the running configuration deployed by ClusterProfiles in each CAPI cluster;
- 2.Recurring snapshots;
- 3.Versioned storage of the configuration;
- 4.Full viewing of any snapshot configuration including the differences between snapshots;
- 5.Rollback to any previous configuration snapshot.
