# Engineering vs. Nice-to-have

Hope St

There is an infinite amount of  
threats but...

...All of them can be assigned to  
1 of 3 categories

**Confidentiality, Integrity,  
Availability**

# The CIA Triad

# Confidentiality

**We want secrets to be secret**

# Integrity

We get what we expect

# Availability

**We can always access the information**

*How is it helpful?*

# The Question

How can the CIA of this project  
be broken?

## **Confidentiality:**

- Who can see this resource?
- How do we store credentials?
  - Do we log sensitive data?

## **Integrity:**

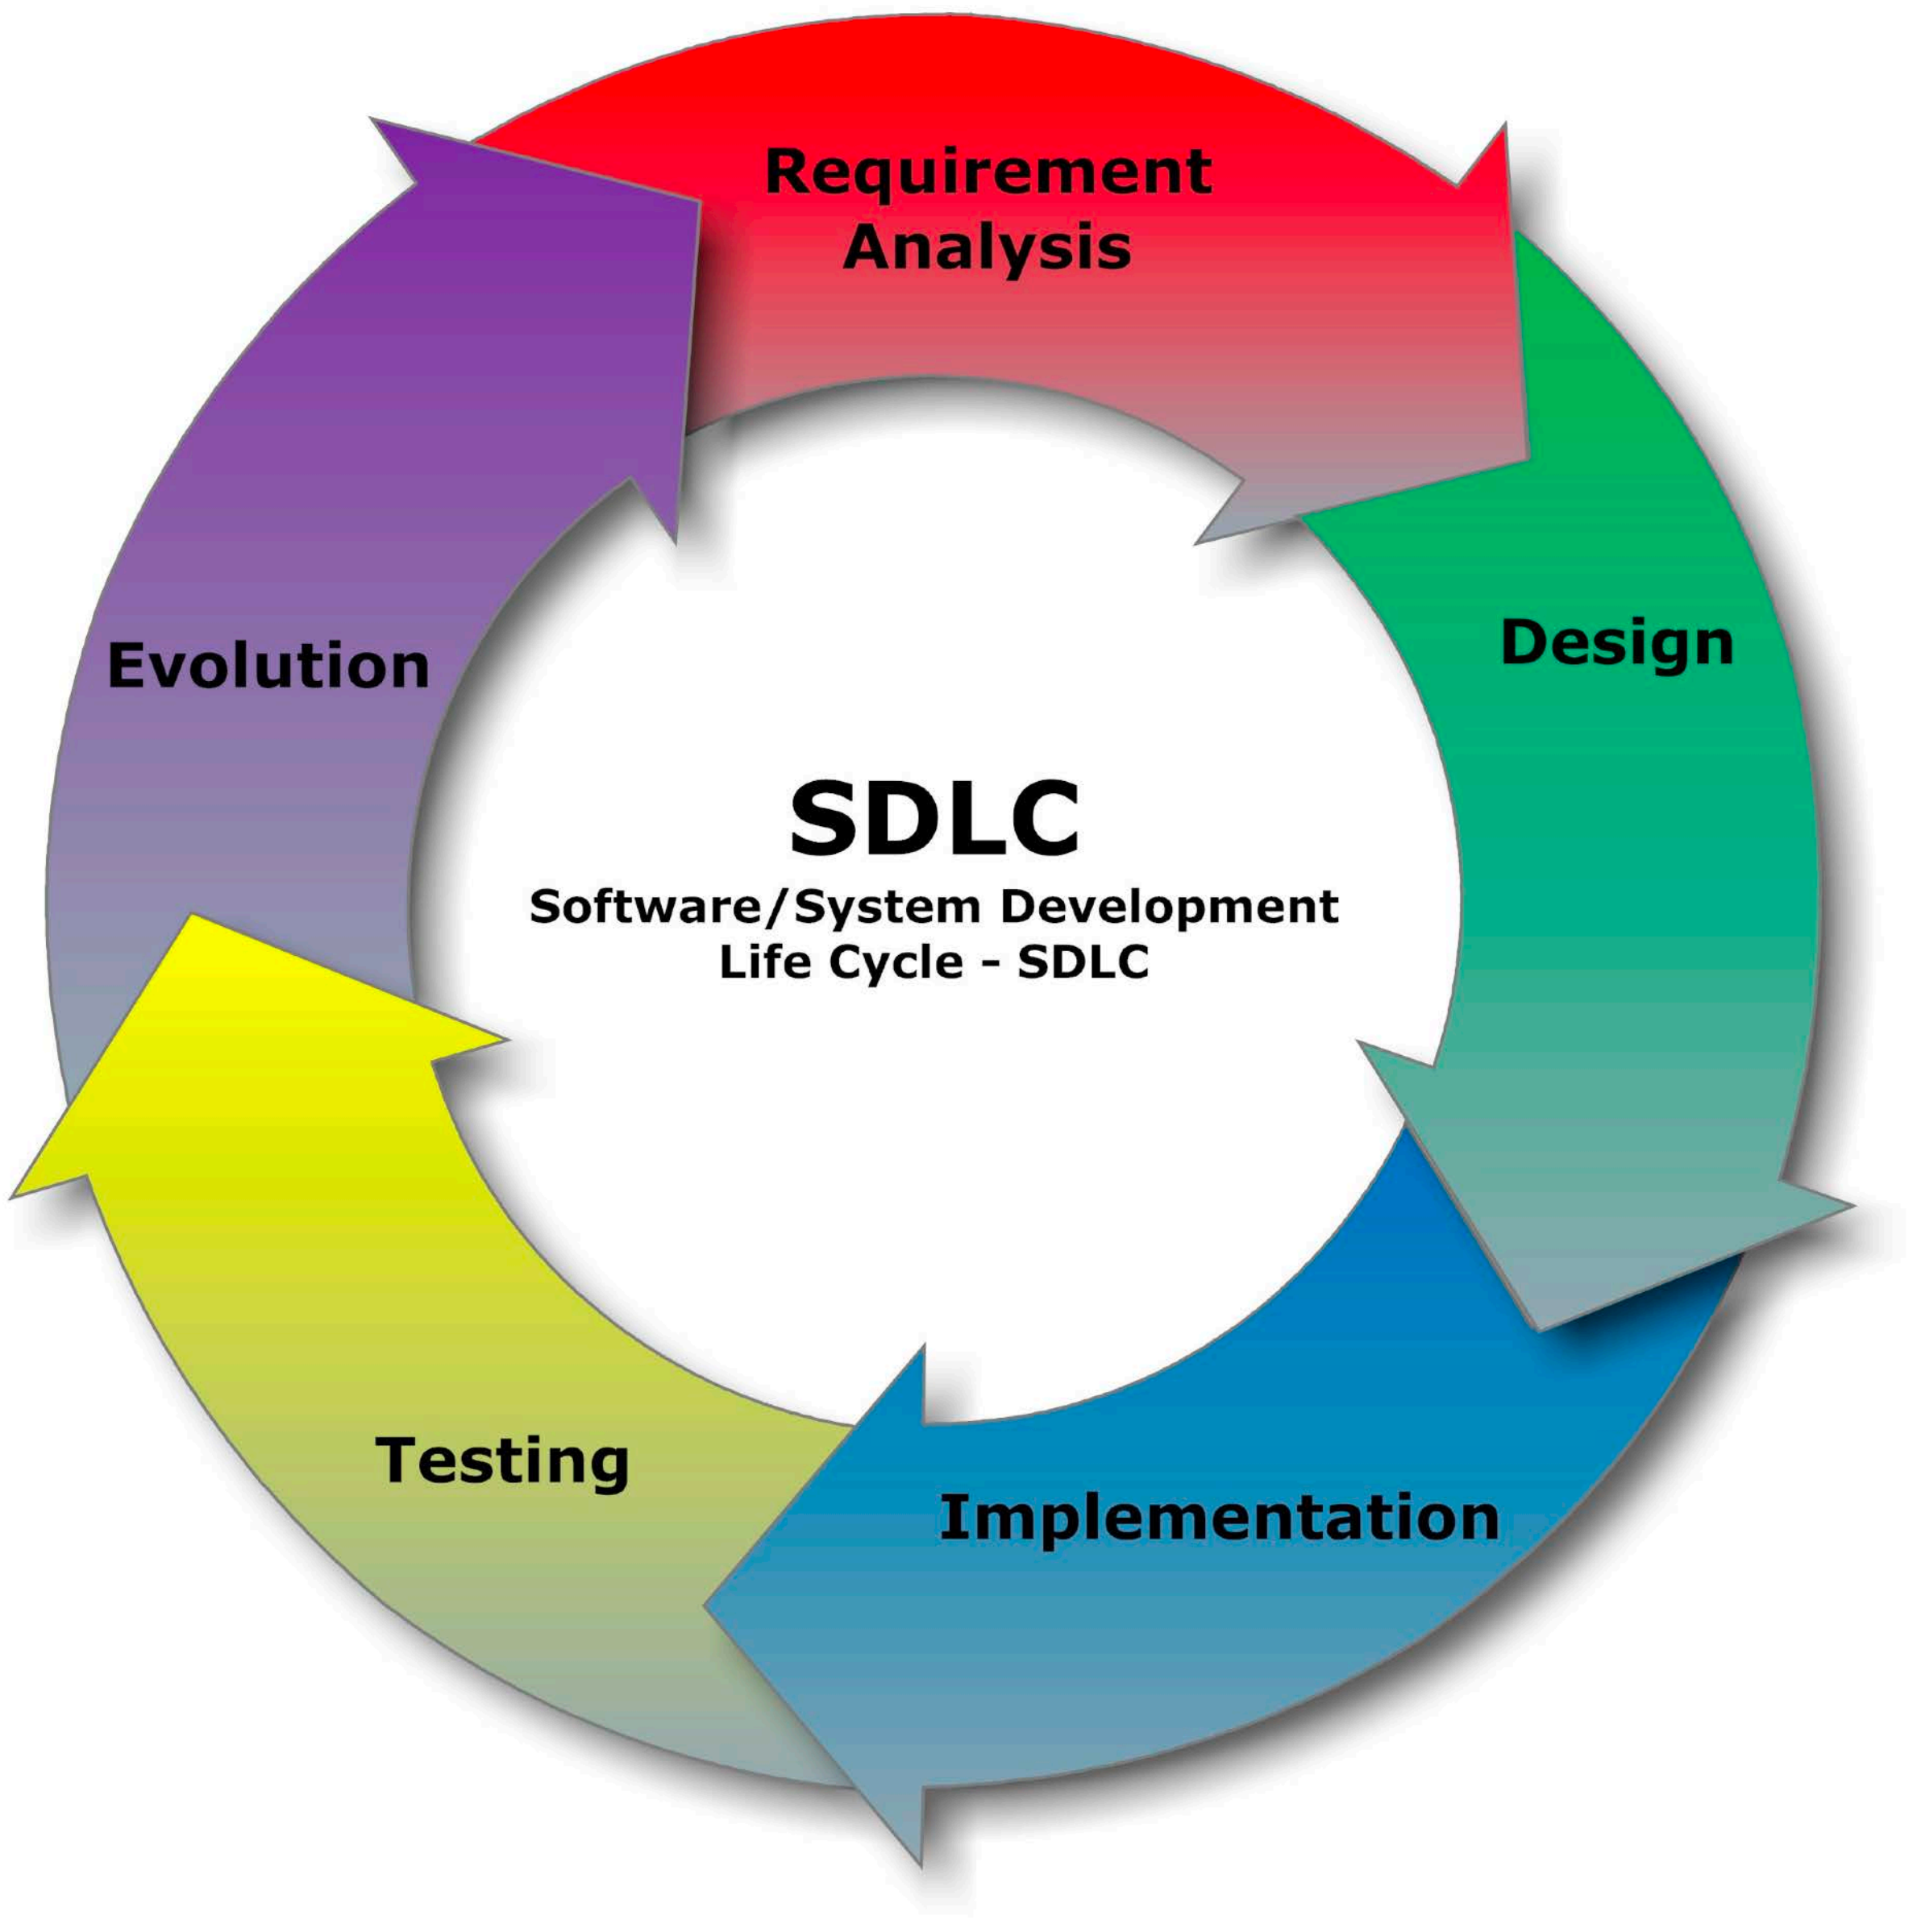

- Who can create, update and remove a resource?
- What happens when malicious data is sent via a form?
  - Is the input sanitised?
  - Are we protected against XSS?

## **Availability:**

- Is this endpoint rate-limited?
- What happens when external product is down?
- How much time does a database migration take?

**When should you do this?**

*Shift security left*

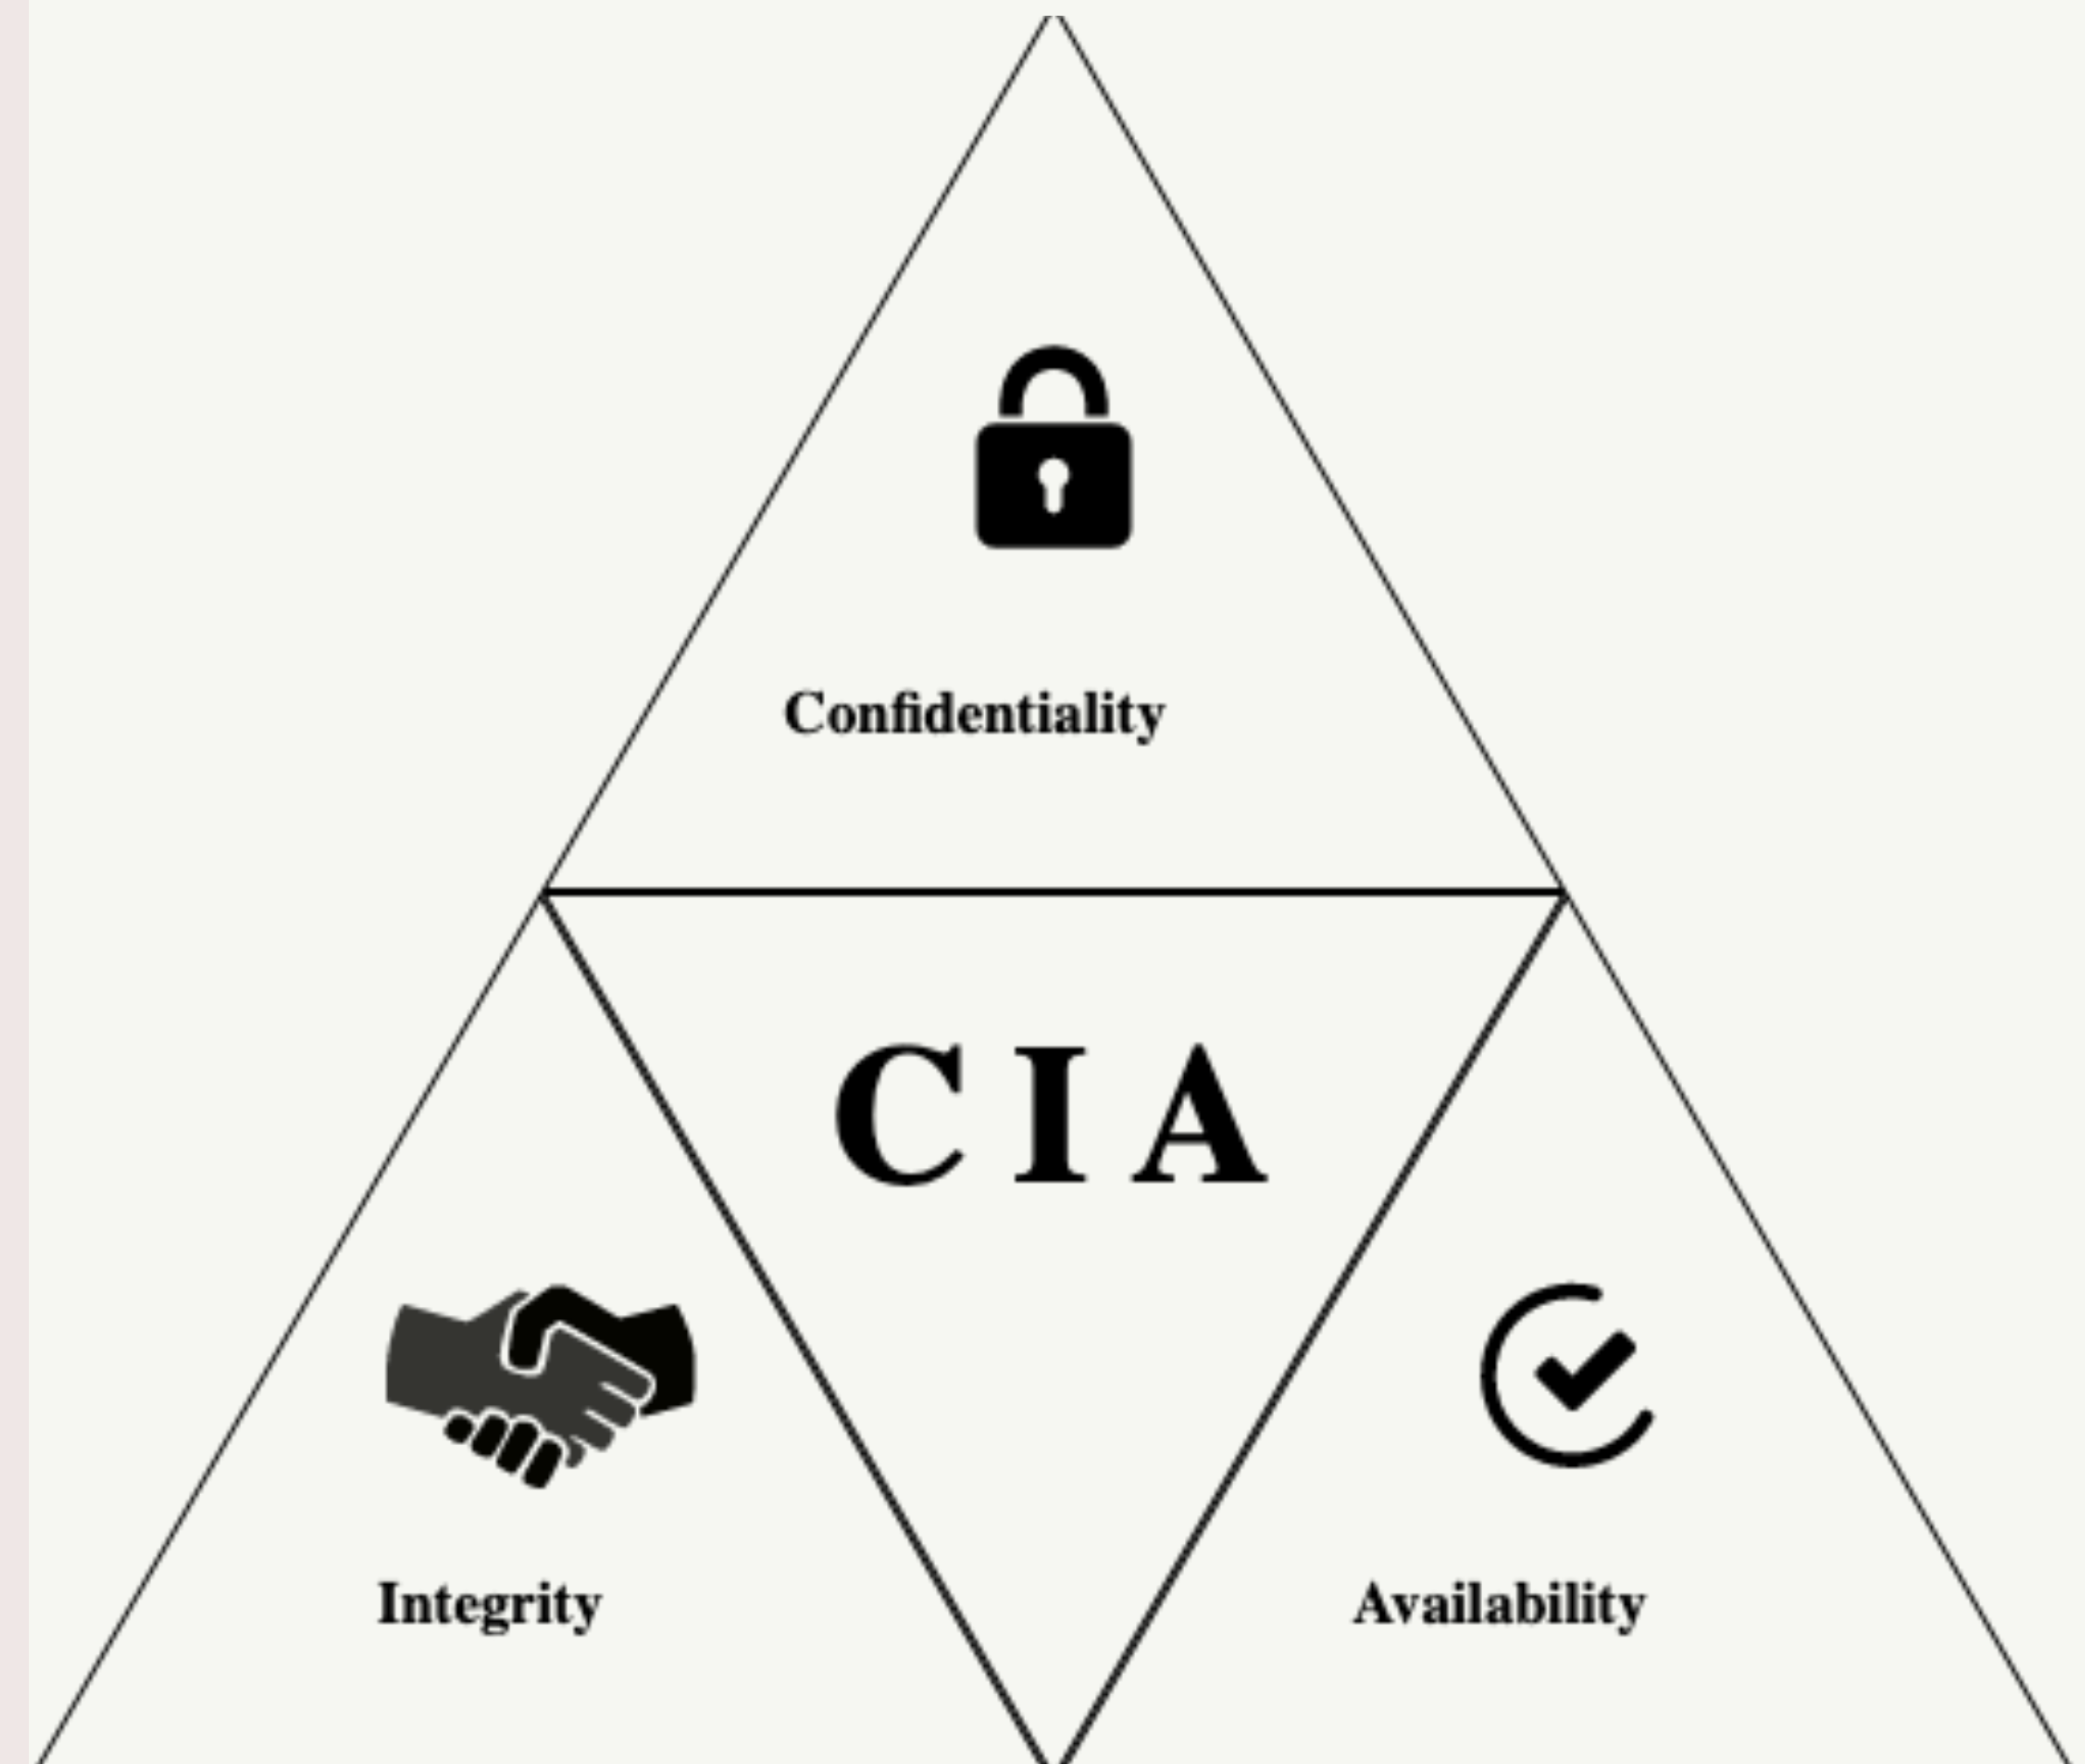

**Analyse ➡ Design ➡ Develop ➡ Test ➡ Maintain**

# How to implement the CIA triad?

**Inject it!**

- Present it to your peers,
- Discuss it with your team,
- Make it part of your process,
- Add it to doc templates:
  - Solution Briefs,
  - Enhancement Proposals,
  - Request for Comments.

*Move fast and break things*  
is over

**Thanks!**

**Let's stay in touch!**
