What is Alert Fatigue?

Alerts, alarms, notifications, etc all contribute to alert fatigue

Whether positive or negative, alerts pull teams out of their work

Signs of Alert Fatigue

1. Delayed response times
2. Missed alerts
3. Ignoring false positives
4. Increased stress and burnout
5. Decreased productivity
6. Lower quality incident reviews and documentation

Methods for Dealing with Alert Fatigue

Don't alert on
success

Don't send alerts
that aren't
actionable

Set appropriate
urgency, and defer
low-urgency alerts

Delete or suspend
broken alerts

Task 1: Alert Cleanup Sprint

**Make time to concentrate on
cleaning up your existing alerts**

.....

Is it actionable?

Is it urgent?

Is it helpful?

Does it bring you joy?

SLOs

Service Level Objectives

Your goals for your production metrics

Stop alerting on
every error

Allow you to
calculate an **Error
Budget** - what's left
after your 9s

9 9 9 **9**

Change the volume
of alerts by adding
thresholds based
on your Error
Budget

Error Budgets

The Users are the Point

What is important to the users?

How do you know?

Is it different for different parts of the application?

Goals

Reduce Overall
Alert Load

Low volume of high
urgency

Every alert that
reaches a **human**
responder is
actionable

Most alerts are
novel

Summary

1. Clean up alerts!
2. Focus on your users with SLOs and prioritize alerts on those metrics
3. Get the junk out of the human workflow with automation
4. Train the machines to be effective teammates

Manager not bought in?

Discuss the negative impacts already felt on the team and on the performance of your services.
